Everyday - Development Assistance Prompts

Project: Everyday book storefront | **Updated:** 12 October 2026

Selected assistance requests, organized by topic and condensed for clarity. This is a summary rather than a verbatim transcript. It covers feature changes, implementation support, design review and explanations.

1. Storefront and discovery

Help me improve the existing Everyday storefront with product search, price sorting, stock filtering and clear loading states. Keep the interface consistent with the FastAPI product API.

2. Registration and authentication

Help me connect registration and login. Review password hashing, JWT expiry and protected routes. Explain where the logged-in user is verified and how the browser keeps the access token.

3. Cart and checkout

Help me connect the bag controls to the signed-in user's cart. Review quantity limits and unavailable products. Save an unpaid order with item snapshots and prevent a retry from creating a duplicate.

4. Shopping assistant and policies

Help me connect the shopping assistant to the catalog and cart. Use the store policy PDF for retrieval-based answers with page references. Keep replies within the store's scope and add items only when requested.

5. Book scraping and comparison

Reintroduce Books to Scrape using WebBaseLoader and Beautiful Soup. Replace demo titles with matching books and add a Compare price button showing the store price against the source price.

6. Comparison through chat

When I explicitly ask the agent to compare a product's price, let it call the comparison tool. When it finds or recommends products, show product cards with a Compare price button so the user can choose to compare.

7. Understanding the cache

Explain how comparison caching works, where it is stored and what is used. Clarify when the source is fetched again, what a restart does, and whether store prices are cached too.

8. Order information

Let the agent fetch my order history and details of a specific order. Bind the tools to the logged-in user and use saved order information for items, prices, status and shipping address.

9. Chat history and sessions

Explain how chat history is managed and sent to the agent. Clarify the message limit, what survives a refresh, and what happens on clearing chat, logout or session expiry.

10. Documentation and verification

Update the site poster and low-level design to match the current implementation. Organize assistance prompts with concise headings. Verify the main flows and distinguish completed features from future work.

Reading this log

Read these requests alongside the source code, low-level design and validation results. The original conversation contains the full wording and follow-up discussion.
